Sets and Dictionaries

Exercises

Week 7

Prior to attempting these exercises ensure you have read the lecture notes and/or viewed the video, and followed the practical. You may wish to use the Python interpreter in interactive mode to help work out the solutions to some of the questions.

Download and store this document within your own filespace, so the contents can be edited. You will be able to refer to it during the test in Week 6.

Enter your answers directly into the highlighted boxes.

For more information about the module delivery, assessment and feedback please refer to the module within the MyBeckett portal.

Specify two ways in which a Set varies from a List. Answer:	-
A Set differs from a List in two ways: the items' uniqueness and their i	nutability.
	- -

Write a Python statement that uses the set() constructor to produce the same Set as the following -

```
languages = { "C++", "Java", "C#", "PHP", "JavaScript" }
```

Answer:

```
languages_set = set(["C++", "Java", "C#", "PHP", "JavaScript"])
```

	Is a Set mutable or immutable?
	Answer: A Set is mutable.
	Why does a Set not support <i>indexing</i> and <i>slicing</i> type
	operations?
	Answer:
	Since sets in Python are by nature unordered collections of unique elements, to perform indexing or slicing operations.
	Why is a frozenset() different from a regular set?
	Answer:
	A regular set and a frozenset() vary in that a frozenset is immutable while a Py
	is changeable, allowing for dynamic updates. Regusets cannot be hashed, but frozensets may be, making them useful as elements in other sets or keys in
	dictionaries.
	How many elements would exist in the following set?
ıar	mes = set("John", "Eric", "Terry", "Michael", "Graham", "Terry")
	Answer:

vowels = set("aeiou")

Δ	n	0	11	_	r

In the set `vowels = set("aeiou")`, there are five unique elements representing the vowels in the English alphabet: 'a', 'e', 'i', 'o', and 'u'.

What is the name given to the following type of expression which can be used to programmatically populate a set?

```
chars = \{chr(n) \text{ for } n \text{ in range}(32, 128)\}
```

Answer:

The name given to the following type of expression which can be used to programmatically populate a set is **set comprehension**.

What **operator** can be used to calculate the intersection (common elements) between two sets?

Answer:

The operator used to calculate the intersection (common elements) between two sets is the ampersand (&).

_____ What **operator** can be used to calculate the difference

between two sets?

Answer:

The operator used to calculate the difference between two sets is **the minus sign** or hyphen (-).

What would be the result of each of the following expressions?

```
\{ "x", "y", "z" \} < \{ "z", "u", "t", "y", "w", "x" \}
```

Answer:

True

```
\{ x'', y'', z'' \} < \{ z'', y'', x'' \}
```

Answer:

False

```
{ "x", "y", "z" } <= { "y", "z", "x" }
```

Answer:

True

```
\{ \| x^{*} \| \} > \{ \| x^{*} \| \}
```

Answer:

False

```
\{ "x", "y" \} > \{ "x" \}
```

Answer:

True

```
\{ \text{"x", "y"} \} == \{ \text{"y", "x"} \}
```

Answer:

True

Write a Python statement that uses a **method** to perform the equivalent of the following operation -

```
languages = languages | { "Python" }
```

Answer:

A Python statement that uses a method to perform the equivalent of the given operation is languages = languages.union({"Python"})
Do the elements which are placed into a set always remain
in the same position?
Answer:
No, the elements in a set do not have a fixed position or order. Sets are unordered collections of unique elements.
Is the following operation a mutator or an accessor ?
languages &= oo_languages
Answer:
The operation languages &= oo_languages is a mutator operation.
What term is often used to refer to each pair of elements
stored within a dictionary?
Answer:
The term used to refer to each pair of elements stored within a dictionary is "key-value pair."
Is it possible for a dictionary to have more than one key
with the same value?
Answer:
Yes, a dictionary can have more than one key with the same value.

Is it possible for a dictionary to have the same value appear more than once? Answer: Yes, it is possible for a dictionary to have more than one key with the same value. Is a Dictionary mutable or immutable? Answer: A Dictionary is mutable. Are the key values within a dictionary mutable or immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer: The dictionary stock contains three elements.	
Answer: Yes, it is possible for a dictionary to have more than one key with the same value. Is a Dictionary mutable or immutable? Answer: A Dictionary is mutable. Are the key values within a dictionary mutable or immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	sible for a dictionary to have the same value
Yes, it is possible for a dictionary to have more than one key with the same value. Is a Dictionary mutable or immutable? Answer:	
Is a Dictionary mutable or immutable? Answer: A Dictionary is mutable. Are the key values within a dictionary mutable or immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	
Answer: A Dictionary is mutable. Are the key values within a dictionary mutable or immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	lictionary to have more than one key with the same value.
Answer: A Dictionary is mutable. Are the key values within a dictionary mutable or immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	
Answer: A Dictionary is mutable. Are the key values within a dictionary mutable or immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	
A Dictionary is mutable. Are the key values within a dictionary mutable or immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	or immutable ?
Are the key values within a dictionary mutable or immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	
immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	
immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	
immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	
immutable? Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	
Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	key values within a dictionary mutable or
Answer: The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	
The key values within a dictionary is immutable. How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	
How many elements exist in the following dictionary? stock = {"apple":10, "banana":15, "orange":11} Answer:	
<pre>stock = {"apple":10, "banana":15, "orange":11} Answer:</pre>	dictionary is immutable.
<pre>stock = {"apple":10, "banana":15, "orange":11} Answer:</pre>	
<pre>stock = {"apple":10, "banana":15, "orange":11} Answer:</pre>	
<pre>stock = {"apple":10, "banana":15, "orange":11} Answer:</pre>	any elements exist in the following dictionary?
Answer:	ing elements exist in the following dictionary?
	0, "banana":15, "orange":11}
The dictionary stock contains three elements.	
	ntains three elements.
And, what is the data-type of the keys ?	e of the keys ?
Answer:	
The data type of the keys in the dictionary is a string.	

And, what output would be displayed by executing the

```
following statement - print (stock["banana"])
```

Answer:

The output of print(stock["banana"]) would be 15.

Write a Python statement that uses the dictionary() constructor to produce the same dictionary as the following -

```
lang gen = { "Java":3, "Assembly":2, "Machine Code":1 }
```

Answer:

A Python statement that uses the dictionary() constructor to produce the same dictionary as the given above is lang_gen = dict({"Java": 3, "Assembly": 2, "Machine Code": 1})

Now write a simple expression that tests whether the word "Assembly" is a member of the dictionary.

Answer:

is_assembly_in_dict = "Assembly" in lang_gen

Write some Python code that uses a for statement to iterate over a dictionary called <code>module_stats</code> and print only its values (i.e. do not output any keys) -

Answer:

```
for value in module_stats.values():
    print(value)
```

Now write another loop which prints the only the keys -

Answer:

for key in module_stats.keys(): print(key)

Is it possible to construct a dictionary using a **comprehension** style expression, as supported by lists and sets?

Answer:

Yes, it is possible to construct a dictionary using a comprehension style expression known as a dictionary comprehension.

When a Dictionary type value is being passed as an argument to a function, what characters can be used as a prefix to force the dictionary to be **unpacked** prior to the call being made?

Answer:

When passing a dictionary as an argument to a function, the double-asterisks (**) can be used as a prefix to make it unpack first.
